PATENT

IN THE CLAIMS

Please amend the following claims to appear as indicated:

B1 Sub C1

1. A system comprising:
a first program to manipulate an item;
a database having the item;
a source code control (SCC) system to store versions of the item; and
a second program to check in and check out the item, such that
modification of the item is restricted when the item is checked out.

B2 Sub C2

2. The system of claim 1, wherein the first program comprises an editor program
to edit the stored item.

3. The system of claim 1, wherein the first program requests to check out the
item such that the second program checks out the item to the first program.

B3 Sub C3

4. The system of claim 3, wherein the second program provides the first program
a choice of one or more different versions of the item at the source code control (SCC) system
and one or more different versions of the item at the database.

B4 Sub C4

7. The system of claim 1, wherein the first program requests to check in the item
such that the second program checks in the item into the source code control (SCC) system.

DOCKET NO: MSFT-0508/37457.1

3

PATENT

B4 C6 and
8. The system of claim 7, wherein the second program checks in the item into the source code control (SCC) system as saved to the database.

B5
Sub C5
10. A computer-implemented method to check out an item from a source code control (SCC) system comprising:
comparing a stream of the item in the source code control (SCC) system with a stream of the item in a database;
determining whether the stream in the source code control (SCC) system is identical to the stream in the database;
upon determining that the system in the source code control (SCC) system is different than the stream in the database, providing a user a choice to select one of the stream in the source code control (SCC) system and the stream in the database; and
checking out the item selected by the user, such that modification of the item is restricted when the item is checked out.

B6
Sub C6
15. A computer-readable medium having instructions stored thereon for execution by a computer to perform a method comprising:
comparing a stream of an item in the source code control (SCC) system with a stream of the item in a database;
determining whether the stream in the source code control (SCC) system is identical to the stream in the database;
